

# Hashicorp

At ISW, we use [Hashicorp Vault](#) as well as [Hashicorp Boundary](#).

- [Vault](#)
- [Boundary](#)

## Vault

Vault is software to securely store secrets like passwords, tokens, SSH Keys, ... This is useful because secrets are no longer shared on the machines itself, the client makes a request to Vault to retrieve the secret.

- [Creating policies](#)
- [Logging into a machine using SSH via Vault](#)

## Boundary

Boundary is used to enable secure remote access to internal services. Meaning no VPN is required to access Virtual Machines, Routers in our network.
